Removing and installing the torque converter

Removing

1. Remove transmission.
2. Remove converter, with transmission in horizontal position.

Note

Do not damage converter bearing assembly and rotary shaft seal.

Installing

1. Carefully insert converter, with transmission in horizontal position. Turn the converter to and fro until the gear tothing engages and the installation position is reached.

2. Secure converter against falling out with special tool 9325

413-32

412-32

A = approx. 25 mm

Removing and installing the position switch on transmission

Removing

1. Move selector lever to position "N".
2. Remove transmission underbody cladding.
3. Disconnect selector lever cord pull at actuating lever.
4. Remove actuating lever.

381-37a

- A = Selector lever cord pull
 B = Actuating lever
 C = Hexagon nut (M 8 x 1) with washer
 D = Fixing screws

5. Unlock cable holder, remove plug-in connection and disconnect.

397-37

6. Unscrew fixing screws for position switch and remove switch.

Installing

Installation takes place in reverse order.

Tightening torques:

- Position switch to transmission = 10 Nm
 Actuating lever to switching shaft = 15 Nm

1. Set selector shaft to position "N" (turn shaft anti-clockwise up to the stop and then back two clicks) and place switch in the correct position.

2. Check, and if necessary adjust, setting of selector lever cable.

1884-37

2. Adjusting multifunctional switch.

— Push pointer of special tool **9326** onto the selector shaft and turn the switch until the locating pin can be pushed into the fixing hole of the switch. Tighten the mounting screws to **10 Nm** (7 ftlb.) in this position.

398-37

A = locating pin

Adjusting cable for selector device

1. Move selector lever to position "1".
2. Move multi-function switch to position "1" by pushing forward operating lever on switch by maximum amount.
3. Push cable forward and adjust position of fork head until bore holes of fork head and operating lever on gearbox lie exactly one over the other. From this position rotate fork head a further two turns onto thread of cable.
4. Check adjustment by shifting through all the gears and confirming that gear is displayed on speedometer. In addition change gate from "D" to "M". This must be possible with one smooth, straightline movement.

Removing and installing cable for selector mechanism

Removing and installing cable for selector mechanism

| No. | Designation | Qty. | Note: | |
|-----|--------------|------|---------|--|
| | | | Removal | Installation |
| 1 | Fork head | 1 | | Screw on to half length of thread on cable |
| 2 | Hexagon nut | 1 | | Tighten to 6 Nm (4.4 ftlb) |
| 3 | Gaiter seal | 1 | | |
| 4 | Guide tube | 1 | | |
| 5 | Fork head | 1 | | |
| 6 | Hexagon nut | 1 | | Tighten to 6 Nm (4.4 ftlb) |
| 7 | Gaiter seal | 1 | | |
| 8 | Guide tube | 1 | | |
| 9 | Washer | 1 | | |
| 10 | Rubber mount | 1 | | Install in correct position |
| 11 | Spacer tube | 1 | | |
| 12 | Rubber mount | 1 | | Install in correct position |
| 13 | Washer | 1 | | |
| 14 | Cable | | | Readjust |

Instructions for removal and installation

Removal

1. Remove underfloor paneling for gearbox and center underfloor paneling.
2. Disconnect cable on operating lever and remove fork head.

381-37

A = Fork head

3. Disconnect guide tube on bracket

494-37

4. Disconnect cable on selector lever casing and disconnect guide tube.

Installation

1. Installation is carried out in reverse order.
2. Adjust cable for selector mechanism (see P. 37 - 102a).

Removing and installing gear selecting system

Removal

1. Disconnect battery.
2. Remove center underside panel.
3. Disengage selector lever cable from deflection lever and undo guide tube.

1066-37

4. Unscrew release button and pull off selector knob.
5. Remove center console.
6. Disconnect cable valve body from switch plate (only for keylock models).

1067-37

7. Disconnect connectors for switch plate.
8. Unscrew four mounting screws (M 6) and take out selector lever operator from above.

Installation

Tightening torques:

Gear selecting system to body = 10 Nm (7 ftlb)

Cable valve body to switch plate = 2,5 Nm (2 ftlb)

1. Install in reverse order.
2. Press selector knob manually until it is up against the stop, making sure the twist lock engages in the cutout in the selector lever.
3. Check release button for smooth operation. It must return into the home position by itself.
4. Check selector lever cable adjustment and readjust if required.
5. Check operation of keylock and shiftlock (if fitted).

Dismantling and assembling selector mechanism

Dismantling and assembling selector mechanism

492-37

| No. | Designation | Qty. | Note: | |
|-----|---------------------------|------|--|---|
| | | | Removal | Installation |
| 1 | Unlocking button | 1 | Unscrew by hand | Must return automatically to original position after operation |
| 2 | Selector lever handle | 1 | Pull off by hand | Press on in correct position until properly in contact. Twisting lock must engage with lock on shift lever. |
| 3 | Cover panel | 1 | Can only be taken out from below and with center console removed | |
| 4 | Cover | 1 | | |
| 5 | Hexagon screw | 4 | | Tighten to 10 Nm (7.3 ftlb) |
| 6 | Washer | 4 | | |
| 7 | Seal | 1 | | |
| 8 | Hexagon nut | 2 | | Tighten to 2 Nm (1.4 ftlb) |
| 9 | Flat-head screw | 2 | | |
| 10 | Control plate | 1 | | |
| 11 | Clamping screw | 1 | | Tighten to 23 Nm (16.9 ftlb) |
| 12 | Reversing shaft | 1 | | |
| 13 | Rubber mount | 1 | | |
| 14 | Selector lever (complete) | 1 | | |
| 15 | Lock | 1 | | |
| 16 | Gate | 1 | | Must engage in recess in control plate |
| 17 | Selector lever casing | 1 | | |

Note

Coat all sliding surfaces in low-temperature grease (e.g. Shell S 6508)

Dismantling and assembling gear selecting system with keylock and shiftlock**Tools**

| No. | Designation | Special tool | Order number | Explanation |
|-----|------------------|--------------|----------------|-------------|
| | Assembly mandrel | 9542 | 000.721.954.20 | |

Dismantling and assembling gear selecting system with keylock and shiftlock

| No. | Designation | Qty. | Note: | |
|-----|----------------------|------|--|---|
| | | | Removal | Installation |
| 1 | Release button | 1 | Screw off manually | Must return to home position automatically after it has been actuated |
| 2 | Selector knob | 1 | Pull off manually | Push up to stop in correct position. Twist lock must engage in cutout in selector lever |
| 3 | Shroud | 1 | Can only be removed from below with the center console removed | |
| 4 | Cover | 1 | | |
| 5 | Hexagon head screw | 2 | | Tighten to 2.5 Nm (2 ftlb) |
| 6 | Sleeve | 2 | | |
| 7 | Switch plate | 1 | | |
| 8 | Plug | 1 | | |
| 9 | Tensioning sleeve | 1 | Drive out using Special Tool 9542 | Bore of driver and relay shaft must match |
| 10 | Deflection lever | 1 | | |
| 11 | Seal | 1 | | |
| 12 | Rubber mount | 1 | | |
| 13 | Selector lever | 1 | Shift into manual speed selection gate | |
| 14 | Driver | 1 | | |
| 15 | Hex socket head bolt | 2 | | Tighten to 6.5 Nm |
| 16 | Shift-Lock | 1 | | |
| 17 | Plug | 1 | | |
| 18 | Cover | 1 | | |
| 19 | Gasket | 1 | | |
| 20 | Housing | 1 | | |

Note

Coat all sliding surfaces with low-temperature grease (e.g. Shell S 6508)

Removing and installing lift solenoid for shiftlock

Note

When checking the lift solenoid electrically, be sure to observe correct polarity

Terminal 1 = Positive

Terminal 2 = Negative

Removal

1. Remove center console and gear selecting system.
2. Remove switch plate.
3. Using a suitable tool, press connecting rod carefully off the lift solenoid.

1085-37

4. Screw out mounting screws and take off lift solenoid.

Installation

1. Set selector lever to "1" position.
2. Grease ball and ball socket with low-temperature grease.
3. Clip connecting rod to lift solenoid, retaining the connecting rod in correct position using a suitable wire hook or marking tool and pushing the free lift solenoid carefully into the ball socket.

4. Using sleeves and hexagon head bolts, fit lift solenoid to gate in such a manner that it remains free to slide in an axial direction.

5. Adjusting the lift solenoid:

- Set selector lever to position „P“.
- Slide lift solenoid all the way back in the slots of the gate.
- Push iron core from the lift solenoid towards the pawl until it contacts the stop and locate it in this position.
- Slide the actuated lift solenoid axially until the idler contacts the stop of the pawl.
- Tighten hexagon head bolt to 2.5 Nm (2 ftlb) in this position.

1086-37

- | | |
|-----------------------|---------------|
| 1 - Hexagon head bolt | 2 - Sleeve |
| 3 - Lift solenoid | 4 - Iron core |
| 5 - Connecting rod | 6 - Pawl |
| 7 - Idler | |

6. Check operation of shiftlock.

Removing and installing keylock bowden cable

Removal

1. Disconnect battery.
2. Remove complete center console, knee guard and side nozzle.
3. Undo Central Information System and leave it suspended on the wiring.
4. Turn ignition lock to position „2" (Ignition on).

Note

The ignition lock must be in position „2". If it is left in any other position, both the lock and the bowden cable may be damaged.

5. Unbolt bowden cable from ignition lock.

1068-3/

6. Undo mounting screws of valve body.

1067-37

7. Disengage bowden cable from pedal floor-board and from bracket for center console.

Installation

1. Assemble in reverse order, observing the following points.
2. Turn ignition lock to position „2" (Ignition on) and fit bowden cable to ignition lock. Tightening torque: 2.5 Nm (2 ftlb)
3. Fit bowden cable valve body using sleeves and hexagon head bolts. Tightening torque: 2.5 Nm (2 ftlb)
4. Set selector lever to position „P" and turn ignition lock to position „0".

Note

If the ignition lock cannot be turned to the 0 position, the bowden cable must be re-adjusted.

5. Adjust bowden cable, turning the cable sleeve on the valve body until the lock slide reaches a setting of $2 + 0.5$ mm (refer to Fig.).

1081-37

$$A = 2 + 0.5 \text{ mm}$$

6. Check operation of keylock and shiftlock.

Checking keylock and shiftlock

Checking the keylock (ignition key lock)

| Selector lever position | Position of release button | Keylock operation | Ignition key |
|-------------------------|----------------------------|-------------------|--------------------------------------|
| P | not actuated | no | rotary, may be pulled off |
| P | actuated | yes | cannot be turned to pulloff position |
| R-N-D-3-2-1 | not actuated actuated | yes | cannot be turned to pulloff position |

Checking the keylock (selector lever lock)

| Ignition key position | Release button status | Keylock operation | Selector lever |
|-------------------------------|-----------------------|-------------------|----------------|
| Pulled off or pulled position | locked | yes | locked |
| Position 1 or 2 | not locked | no | not locked |

Checking the shiftlock

| Selector lever position | Ignition | Shiftlock operation | Brakes | Selector lever |
|-------------------------|----------|---------------------|--------------------------|----------------|
| P-R-N-D-3-2-1 | off | no | actuated not actuated | not locked |
| P and N | on | yes | not actuated | locked |
| P and N | on | yes | actuated | not locked |

Removing and installing rear transmission case

Tools

| No. | Designation | Special tool | Order number | Explanation |
|-----|---------------------|--------------|----------------|-------------|
| 1 | Transmission holder | 9324 | 000.721.932.40 | |
| 2 | Holding device | 9325 | 000.721.932.50 | |
| 3 | socket key insert | 9330 | 000.721.933.00 | |

Removing and installing rear transmission case

| No. | Designation | Qty. | Note: | |
|-----|------------------------|------|------------------------------------|---|
| | | | Removal | Installation (= ftlb) |
| 1 | Fillister head screw | 4 | Use Special Tool 9330 to remove | Tighten with 23 Nm (17) |
| 2 | Joint flange | 1 | | |
| 3 | O-ring | 1 | | Replace, oil slightly |
| 4 | Screw plug | 3 | | Tighten with 50 Nm (36) |
| 5 | Sealing ring | 3 | | Replace |
| 6 | Fillister head screw | 3 | Remove with Torx insert T50 | Tighten with 46 Nm (34) |
| 7 | Fillister head screw | 3 | Remove with Torx insert T50 | Tighten with 46 Nm (34) |
| 8 | Fillister head screw | 6 | Remove with Torx insert T50 | Tighten with 46 Nm (34) |
| 9 | Rear transmission case | 1 | | |
| 10 | Protective tube | 1 | | Large diameter to final drive |
| 11 | Seal | 1 | | Replace, glue to case with a small quantity of grease (vaseline) |
| 12 | Shim | X | Note thickness for re-installation | Redetermine thickness if required (refer to page 38 - 171) |
| 13 | Needle cage | 1 | | |
| 14 | Angle ring | 1 | | Fit in correct position |
| 15 | Automatic transmission | 1 | | Pay attention to installation position of clutch A. Make sure that the square drive shaft rings are correctly fitted. Coat the drive shaft with a small quantity of grease in the area of the square rings. |

* Must be checked and, if required, corrected after each transmission installation.

Assembly instructions for removal and installation

Removal

1. Remove the transmission and torque converter.
2. Secure transmission on assembly block with holding device 9324.

415-37

Installation

1. Check the installation position of clutch A. The installation depth has been reached when the distance "C" is approx. 8.5 mm.

416-37

- A = Clutch A
B = Square rings
C = Installation depths

Removing and installing the intermediate plate

Removing and installing the intermediate plate

| No. | Designation | Qty. | Note: | |
|-----|--|------|---|--|
| | | | Removal | Installation |
| 1 | Hexagon screws | 1 | | Tighten with 46 Nm |
| 2 | Washer | 1 | | |
| 3 | Fillister head screw | 11 | | Tighten with 23 Nm |
| 4 | Fillister head screw | 6 | | Tighten with 23 Nm |
| 5 | Front transmission cover* | 1 | | |
| 6 | Seal | 1 | | Replace |
| 7 | O-Ring | 1 | | Replace, oil with ATF |
| 8 | Shim | X | Note thickness for reinstallation | |
| 9 | Gear wheel with tapered-roller bearings* | 1 | Note correct position for reinstallation | Adjust preload if required |
| 10 | Gear wheel with bearing assembly* | 1 | Note correct position for reinstallation | Set by the manufacturer. |
| 11 | Fillister head screw | 2 | | Tighten with 23 Nm |
| 12 | Intermediate plate* | 1 | | |
| 13 | Seal | 1 | | Replace |
| 14 | Protective tube | 1 | | Large diameter to final drive |
| 15 | Tapper roller bearing outer race | 1 | Remove with internal pul- ler (e.g. Schrem 60 - 70) | Heat transmission cover to approx. 120 deg. C and press in to stop |
| 16 | Adjusting shim | X | Record thickness for reinstallation | Redetermine thickness if required |
| 17 | Automatic transmission with final drive | 1 | | |

Note

The spur gear drive is only available as a complete set (intermediate plate, transmission cover and adjusted spur gears). No adjustment of the preload of the taper roller bearings is therefore required.

Dismantling and assembling intermediate plate

Tools

1027-37

| No. | Designation | Special tool | Order number | Explanation |
|-----|------------------|--------------|----------------|-------------|
| | Retaining device | 9340 | 000.721.934.00 | |

Dismantling and assembling intermediate plate

| | | | Removal | Installation |
| 1 | Snap ring | 1 | | |
| 2 | Bearing cover | 1 | Grab at lugs to lift out | |
| 3 | Round seal | 1 | | Replace, coat with ATF fluid |
| 4 | Shaft seal | 1 | | Fitting depth 2.0 ± 0.5 mm |
| 5 | Lock nut | 1 | Fit Special Tool 9340 into vise. Put intermediate plate into position and undo nut. | Tighten to 250 Nm (184 ftlb). Lock by upsetting the flange (2 x 180°) |
| 6 | Helical gear | 1 | Press out using a hydraulic press. | |
| 7 | Adjuster ring* | X | Record thickness for reassembly | Thickness can only be determined by manufacturer |
| 8 | Inner race of taper roller bearing* | 1 | Mark for reassembly | Heat to approx. 120°C and press on |
| 9 | Bearing cover * | 1 | | |
| 10 | Round seal | 1 | | Replace, coat with ATF fluid |
| 11 | Inner race of taper roller bearing* | 1 | Remove across assembly bore of helical gear. Mark for reassembly. | Heat to approx. 120°C and press into place |
| 12 | Outer race of taper roller bearing | 1 | | Heat intermediate plate to approx. 120°C and press into place |
| 13 | Breather cover | 1 | Lever off | |
| 14 | Breather tube | 1 | Pull out | Press in to stop |
| 15 | Intermediate plate | 1 | | |

Note

The parts identified by an * have been preadjusted by the manufacturer.

Disassembling and assembling the parking lock

Disassembling and assembling the parking lock

| No. | Designation | Qty. | Note: | |
|-----|----------------------|------|---|--|
| | | | Removal | Installation |
| 1 | Bushing | 1 | | |
| 2 | Fillister head screw | 1 | Remove with Torx insert T27 | Tighten with 10 Nm |
| 3 | Guide plate | 1 | | |
| 4 | Guide piece | 1 | | |
| 5 | Catch | 1 | | |
| 6 | Spring | 1 | | Insert in correct position |
| 7 | Pin | 1 | | |
| 8 | Circlip | 1 | | |
| 9 | Parking lock wheel | 1 | | Make sure that the square ring is correctly seated |
| 10 | Clamping pin | 1 | | |
| 11 | Protective cap | 1 | Drive out to the outside by gentle blows on shaft No. 14 | Replace |
| 12 | Circlip | 1 | | |
| 13 | Shim ring | 1 | | |
| 14 | Shaft | 1 | Mark installation position | Insert in correct position |
| 15 | Notched disk | 1 | | |
| 16 | Rotary shaft seal | 1 | With transmission in built-in condition, remove position switch and carefully lever out with a suitable screwdriver | Wind plastic insulating tape around the shaft toothing as an assembly aid, slightly oil sealing lip and press in flush |

Work instructions for disassembling and assembling

Disassembling

1. Remove transmission.
2. Remove intermediate plate.

Note

Part Nos. 11 to 15 can be removed only when the rear transmission case and the ATF pan have been dismantled.

Assembly

1. Replace O-ring on output shaft.

2. Insert spring for catch in correct position.

418-37

417-37

| 24 | Thrust spring (short) | 4 | | |
| 25 | Thrust spring (long) | 3 | | |
| 26 | Sealing sleeve | 6 | Pull out with Special Tool 9327 | Press in to stop using a suitable mandrel |
| 27 | Sealing sleeve | 1 | Pull out with Special Tool 9327 | Press in to stop, observ- ing correct position |
| 28 | Sealing nut | 1 | | Tighten to 30 Nm (22 ftlb) |
| 29 | Seal | 1 | | Replace |
| 30 | Banjo bolt | 1 | | Tighten to 40 Nm (29 ftlb) |
| 31 | Seal | 2 | | Replace |
| 32 | Flange | 1 | | |
| 33 | Ball (6 mm dia.) | 1 | | |
| 34 | Countersunk screw | 2 | | Tighten to 5 Nm (4 ftlb) |
| 35 | ATF indicator tube | 1 | | |
| 36 | Sealing ring | 1 | | Replace |
| 37 | Hose clamp | 2 | | |
| 38 | Flange | 1 | | |
| 39 | Hose | 1 | | |
| 40 | Transmission case | 1 | | |

Dismantling and assembly notes

Dismantling

1. Remove and install rear transmission case (page 37 - 103).
2. Remove and install intermediate plate (page 37 - 107).
3. Remove and install parking lock (page 37 - 111).
4. Drain ATF fluid.
5. Unscrew 13 mounting screws (head dia. 12 mm) for hydraulic control unit and lift off control unit.

6. Pull sealing sleeves out of the bores, using Special Tool 9327.

838-37

399-38

Assembly

1. Using a suitable mandrel, press sealing sleeves into the bores of the transmission case. Make sure the sleeves are not tilted or damaged.

839-37

- A – short sealing sleeves
 B – bevelled sealing sleeve for lubrication pressure feed

- Installation position of the bevelled sealing sleeve for lubrication pressure feed.

840-37

A - Sealing sleeve

- Place thrust springs into position and locate with snap rings.

881-38

A - Long thrust springs
B - Short thrust springs

- Fit wiring harness to transmission case (straight surface on socket points to outside), place control unit into position and tighten all mounting screws lightly.

399-38

A = Screw length = 80 mm
B = Screw length = 65 mm
C = Screw length = 105 mm
D = Screw length = 60 mm

- Put control unit into position, placing detent disk into position 1 (1st gear) and pushing control unit back until it contacts the detent disk. Keeping the unit in this position, tighten mounting screws to **8 Nm**.

385-38

A - Detent disc
B - Selector valve

6. Place inductive rpm pickup into position and fit retainer plate in such a manner that the lugs engage into the grooves of the connector.

390-38b

Dismantling and assembling transmission

897-37

| No. | Designation | Special tool | Order number | Explanation |
|-----|------------------|--------------|----------------|-------------|
| 1 | Assembly sleeve | 9331 | 000.721.933.10 | |
| 2 | Puller hook | 9328/1 | 000.721.932.81 | |
| 3 | Retaining device | 9329/1 | 000.721.932.91 | |
| 4 | Clamp | 9334 | 000.721.933.40 | |

Dismantling and assembling transmission

| No. | Designation | Qty. | Note: | |
|-----|-----------------------------|------|--|---|
| | | | Removal | Installation |
| 1 | Adjusting shim | X | Record thickness for reassembly | Check shim thickness whenever the transmission has been dismantled and redetermine correct thickness as required (refer to page 38 - 171) |
| 2 | Axial needle roller cage | 1 | | |
| 3 | Angled disc | 1 | | Install in correct position |
| 4 | Drive shaft with coupling A | 1 | For dismantling and assembly, refer to page 38 - 168 | |
| 5 | Angled disc | 1 | | Use grease (vaseline) to stick to drive shaft in correct position |
| 6 | Axial needle roller cage | 1 | | |
| 7 | Thrust washer | 1 | | |
| 8 | Disc carrier | 1 | | |
| 9 | Snap ring | 1 | | |
| 10 | Support ring | 1 | | |
| 11 | Round seal | 1 | | Replace, fit with Special Tool 9331 |
| 12 | Clutch B | 1 | Pull out using Special Tool 9328/1. For dismantling and assembly, refer to page 38 - 161 | Check rectangular ring for correct position |
| 13 | Snap ring | 1 | | |
| 14 | C/D pack | 1 | Lift out with Special Tool 9329/1 and place on Special Tool 9314. For dismantling and assembly, refer to page 38 - 143 | Install with Special Tool 9329/1, making sure the 4 oil feed bores line up with the bores for the sealing sleeves |
| 15 | Angled disc | 1 | | Use grease (vaseline) to stick to spider shaft, observing correct position |
| 16 | Axial needle roller cage | 1 | | |

| No. | Designation | Qty. | Note: | |
|-----|---------------------------------------|------|--|---|
| | | | Removal | Installation |
| 17 | Thrust washer | 1 | | |
| 18 | Round seal | 1 | | Replace |
| 19 | Countersunk screw (Torx bit TX 30) | 10 | | Tighten to 10 Nm (7 ftlb). Observe correct tightening torque, otherwise pressure losses at the clutch may result |
| 20 | 4th gear tower | 1 | Use Special Tool 9334 to lift out | Insert with Special Tool 9334 , making sure the three oil feed bores of cylinder E and transmission case line up with each other |
| 21 | Transmission case | 1 | | |

Dismantling and assembly notes

Dismantling

1. Remove round seal from output shaft and put Special Tool 9334 into place.

891-37

3. Take out entire brake pack C'/C/D using Special Tool 9329/1.

893-37

2. Pull out clutch B using Special Tool 9328/1, lifting clutch until a resistance is felt, press back down again and pull out in one go.

892-37

Assembly

1. To prevent the preassembled 4th gear tower from separating again, allow Special Tool 9334 to engage into the groove of the round seal.

885-37

2. Place 4th gear tower minus planetary gear set and sun wheel into housing, observing correct position. The three oil feed bores of cylinder E and transmission case must line up.

3. Place axial needle roller cage, thrust washers, planetary set and sun wheel into place (refer to page 38 - 122).
4. Place brake pack C'/C/D with Special Tool 9329/1 into transmission case, making sure the 4 oil feed bores line up with the bores for the sealing sleeves.

895-37

894-37

5. Place complete clutch assembly B into housing and press down to stop. Slip round seal onto inner part of Special Tool 9331 up to the taper and use outer section to push it in to stop.

Fit support ring and snap ring in the same way.

6. Place drive shaft complete with clutch A into housing and rotate cylinder A to and fro until the teeth, the disc carrier and the discs engage fully with each other. The correct position is achieved if the cylinder face protrudes by approx. 8.5 mm beyond the housing face.

914-37

416-37

- A - Clutch A
- B - Rectangular rings
- C - Fitting depth

Checking the ATF fluid level

The prescribed fluid level is extremely important for perfect functioning of the automatic transmission.

Preconditions for checking:

- Transmission underbody cladding removed
- Vehicle must be horizontal
- Engine operating at idling speed
- Hand brake applied
- Selector lever in position "P"
- ATF temperature 80°C

Check ATF level at 80°C.

Note

The ATF capacity was increased by 0.5 l. The ATF level therefore rises and the 80°C check marks move further up on the oil level tube. Refer to imaginary and dotted lines in the close-up insert.

When checking the ATF level, make sure the fluid level is between those two lines (maximum level **15 mm above the 80°C MAX mark** present, lowest level approx. **3 mm below the 80°C MIN mark** present).

1958-38

A = invalid 80°C mark

The exact ATF temperature can be determined with the system tester 9288.

If necessary, top up missing ATF fluid via the quick-fill device (also refer to page 38-103).

Changing ATF fluid and cleaning the ATF strainer

Capacity: approx. 9.5 l

Change quantity: approx. 3.5 l

Oil type:

ATF-Dexron IID

The ATF fluid must be changed and the ATF strainer cleaned every 40,000 km

When changing the ATF fluid, the vehicle must be horizontal and the engine switched off.

Drain ATF fluid, remove ATF pan and ATF strainer (refer to page 38-109).

Thoroughly clean the strainer and pan.

Fit the ATF strainer with a new O-ring.

Tighten the fixing screws with **8 Nm (6 ftlb)**.

Fit the ATF pan with seal. Tighten the fixing screws with **8 Nm (6 ftlb)**.

Fill with ATF fluid:

First, fill ATF fluid up to the 30°C max. mark via the quick-fill connection with the engine stationary.

391-38

A = Hexagon cap nut (tightening torque
30 Nm = 22 ftlb)

B = Sealing ring (replace)

C = Quick-fill connection

388-38

- A = Quick-fill connection
B = Hose from filling device

Start engine in selector lever position "P" and allow to run at idle speed. Observe the ATF level in the oil level pipe and top up to the 30°C max. marking immediately if required.

Note

The ATF level in the transmission changes with the fluid temperature.

Drive the transmission warm and check the ATF fluid at 80° C.

Be sure to observe the note on page 38-101.

Here, the fluid level must be between the 80°C min. and max. marks.

The exact ATF temperature can be determined with the system tester 9288.

Flushing ATF cooler and lines

Information

If the ATF is carbonized, or if there is sludge or evidence of lining abrasion in the ATF sump, it is not sufficient merely to repair or replace the gearbox; the ATF cooler and line system must be flushed with ATF.

Attach additional hose of ATF filling device (see Workshop Manual Group 3/4) to ATF line with conventional twin connecting piece and flush out cooler and line system using filling device.

490-38

A = Twin connecting piece M 16 x 1.5
with conical seal

B = Additional hose

Removing and installing ATF cooler

Removing and installing ATF cooler

| No. | Designation | Qty. | Note: | |
|-----|------------------------------|------|---------|-----------------------------|
| | | | Removal | Installation |
| 1 | Bracket | 1 | | |
| 2 | Washer-and-screw assembly | 3 | | |
| 3 | Air deflector | 1 | | |
| 4 | Hexagon screw | 1 | | Tighten to 10 Nm (7.3 ftlb) |
| 5 | Washer | 1 | | |
| 6 | ATF cooler | 1 | | |

Removing and installing ATF cooler

Information

The ATF cooler is located in the wheel house in front of the front right-hand wheel. It is attached to the engine oil cooler and is ventilated by the engine oil cooler's two-stage electric blower.

Removal

1. Remove front wheel house liner and lower panel
2. Disconnect ATF lines and seal with suitable plugs.

489-38

3. Unfasten retaining bracket on headlamp housing.
4. Remove bracket, undoing three self-locking hexagon nuts (M8) on the wheel arch and one (M6) for the diagonal brace.
5. Remove air deflector.

6. Remove hexagon screw and take out ATF cooler (illustration shows cooler removed).

487-38

Note

Do not disconnect oil lines from engine oil cooler. Cooler remains in wheel house.

7. Remove ATF lines on cooler.

488-38

1. Installation is carried out in reverse order.

2. Replace O-rings for ATF lines on cooler.

3. Check that rubber edging strips on fan housing and bracket fit properly.

4. Check ATF level and if necessary top up.

Installation

Tightening torques: (= ftlb)

Connection ATF line = 30 Nm (22.0ftlb)

Retaining bracket to headlamp housing = 23 Nm (16.9 ftlb)

Bracket to wheel house = 23 Nm (16.9 ftlb)

Diagonal brace to bracket = 10 Nm (7.3 ftlb)

ATF cooler to engine oil cooler = 10 Nm (7.3 ftlb)

Bolt to ATF cooler = 10 Nm (7.3 ftlb)

Retaining bracket to ATF cooler = 6 Nm (4.4 ftlb)

Retaining plate to retaining bracket = 3 Nm (2.2 ftlb)

Removing and installing the inductive speed sensor

Removing

1. Remove the transmission underbody cladding and ATF pan (refer to page 38-109).
2. Remove the holder for the inductive sensor and pull out sensor.

390-38a

Insert the sensor and mount the holding plate so that the lugs engage in the groove on the connector.

390-38b

A = Connector groove

Installing

Tightening torque:

Holder to control unit = 8 Nm

Installation takes place in reverse order.

Removing and installing the wiring harness for the transmission

Removing

1. Remove the transmission underbody cladding.
2. Remove the position switch (refer to page 37-101).
3. Disconnect the connector from the transmission socket. To do this, turn the bayonet lock to the left and disconnect the connector:

387-38a

- A = Bayonet lock
B = Hexagon nut (a/f 30)

4. Unscrew the hexagon nut for the transmission socket with a suitable extension.
5. Remove the hydraulic control unit with wiring harness (also refer to page 38-109).

6. Mark the push-on sleeves for re-installation and pull off from the solenoid valves.

383-38

Installing

1. Push the push-on sleeves for the solenoid valves up to the stop. Pay attention to cable colors.

383-38

| | Solenoid valves | Cable colors |
|---|--------------------|----------------|
| A | Solenoid valve 1 | (grey-violet) |
| B | Solenoid valve 2 | (green-violet) |
| C | Solenoid valve 3 | (red-violet) |
| D | Pressure regulator | (blue-violet) |

2. Route wiring harness and hang in cable clamps.

384-38

3. Place hydraulic control unit on a suitable surface (e.g. transmission jack) at installation height.

4. Insert the socket with **new O-ring** so that the flattened side faces upwards. Tighten hexagon nut with **12 Nm (9 ftlb)**.

5. Install hydraulic control unit.

6. Connect wiring harness with transmission socket. To do this, carefully insert the connector in the socket (fits only in one position) and lock by turning the bayonet lock to the right.

387-38b

7. Install the position switch and readjust.

Removing and installing the hydraulic control unit

Removing

The transmission wiring harness remains on the transmission.

1. Remove the transmission underbody cladding.
2. Drain off ATF fluid.

386-38a

A = Drain screw with sealing ring

3. Remove ATF pan. To do this, unscrew hollow screw for oil level pipe and six fixing screws.

386-38b

B = Hollow screw
C = Fixing screws

4. Remove ATF strainer with Torx insert T 27.

382-38

390-38a

6. Unscrew 13 fixing screws (head diameter 12 mm) **with Torx insert T 27** and lower control unit only so far as to guarantee that the wiring harness is not subjected to any tension.

Place the control unit on a suitable surface (e.g. transmission jack).

Note

Do not allow the control unit to hang from the wiring harness under any circumstances.

399-38

- A = Screw length 80 mm
 B = Screw length 65 mm
 C = Screw length 105 mm
 D = Screw length 60 mm

7. Mark the push-on sleeves for re-installation and pull off from the solenoid valves.

8. Pull the wiring harness out of the holding clamps and remove the control unit.

Installing

Installation takes place in reverse order.

1. Tightening torques:

- Control unit to transmission = 8 Nm (6 ftlb)
 ATF strainer to control unit = 8 Nm (6 ftlb)
 ATF pan to transmission = 6 Nm (4 ftlb)
 Drain screw to ATF pan = 40 Nm (29 ftlb)
 Hollow screw to ATF pa = 40 Nm (29 ftlb)

2. Push on push-on sleeves for solenoid valves up to the stop. Pay attention to cable colors.

4. Screw in the fixing screws for the control unit and counter slightly. Pay attention to screw lengths.

383-38

399-38

| | Solenoid valves | Cable colors |
|---|--------------------|----------------|
| A | Solenoid valve 1 | (grey-violet) |
| B | Solenoid valve 2 | (green-violet) |
| C | Solenoid valve 3 | (red-violet) |
| D | Pressure regulator | (blue-violet) |

- A = Screw length 80 mm
- B = Screw length 65 mm
- C = Screw length 115 mm
- D = Screw length 60 mm

3. Mount the control unit so that the pin of the notched disk projects into the recess of the selector slide.

5. Position control unit. To do this, move notched disk to position 1 (1st gear) and push control unit back until it rests against the notched disk. Tighten fixing screws with **8 Nm** in this position.

385-38

A = Notched disk
B = Selector slide

6. Insert inductive speed sensor and mount holding plate so that the lugs engage in the connector grooves.

390-38b

7. Fit ATF strainer with O-ring. Tightening torque **8 Nm**.
8. Place two magnets in the beads of the ATF pan, fit seal and secure the pan with the holding brackets so that the short legs press onto the ATF pan.

Note

The two holding brackets with the straight legs must be mounted at the side.

9. Screw in ATF drain screw with new sealing ring. Tightening torque **40 Nm**.
10. Screw in hollow screw for oil level pipe with new sealing rings. Tightening torque **40 Nm**.
11. Fill with ATF fluid
(refer to page 38-103).

Removing and installing solenoid valves

Removing and installing solenoid valves

409-38

| No. | Designation | Qty. | Note: | |
|-----|---------------------------------|------|------------------------------|---|
| | | | Removal | Installation |
| 1 | Fillister head screw | 5 | Remove with Torx insert T 27 | Tighten with 5 Nm (4 ftlb) |
| 2 | Housing with pressure regulator | 1 | | Set by the manufacturer, only replace complete |
| 3 | Fillister head screw | 2 | Remove with Torx insert T 27 | Tighten with 5 Nm |
| 4 | Fillister head screw | 1 | Remove with Torx insert T 27 | Tighten with 5 Nm |
| 5 | Holder | 1 | | |

| 14 | Solenoid valve 1 | 1 | Mark for re-installation | Do not confuse with solenoid valves Nos. 11 and 8 |
| 15 | Hydraulic control unit | 1 | | |

Removing and installing the rotary shaft seal for the ATF pump

Removing

1. Remove transmission and converter.
2. Lever out sealing ring with **VW 681**

419-38

2. Press in sealing ring with special tool **9328** as far as it will go.

420-38

Installing

Installation takes place in reverse order.

1. Wet sealing lip with ATF.

Removing and installing the ATF pump

Removing

1. Remove transmission.
2. Remove torque converter and rear transmission case.
3. Unscrew fixing screws with **Torx insert T27** and remove pump. To do this, screw in two screws opposite each other and carefully drive out the pump by gentle blows on the screw heads

405-38

A = Installation markings
B = O-ring

3. Install pump with new O-ring and centering sleeve. Tighten fixing screws with **10 Nm**.
4. Check pump for easy operation. It must be possible to turn the pump by hand with special tool **9329** without it catching.

406-38

Installing

1. Check bearing bush for run-in scores or damage. The pump must be replaced if there are signs of damage.
2. Oil both pump wheels with ATF fluid and place in the housing so that both installation markings are visibly facing up.

421-38

Dismantling and assembling 4th gear tower

911-38

| No. | Designation | Special tool | Order number | Explanation |
|-----|------------------|--------------|----------------|-------------|
| 1 | Clamp | 9334 | 000.721.933.40 | |
| 2 | Assembly support | 9314 | 000.721.931.40 | |

Dismantling and assembling 4th gear tower

| No. | Designation | Qty. | Note: | |
|-----|-----------------------------|------|---|--|
| | | | Removal | Installation |
| 1 | Sun wheel | 1 | | |
| 2 | Planetary set | 1 | | Check for correct seating of the rectangular ring. Engage into hollow gear with a slight rotary motion |
| 3 | Angled disc | 1 | | Fit in correct position |
| 4 | Axial needle roller cage | 1 | | |
| 5 | Thrust washer | 1 | | |
| 6 | Brake F | 1 | For dismantling, refer to page 38 - 137 | Make sure rectangular rings are located correctly. Rotate them slightly to move them into installation position |
| 7 | Clutch E | 1 | For dismantling, refer to page 38 - 131 | Fit with a rotary motion. The specified position is achieved when cylinder E rests against the copper angle disc |
| 8 | Thrust washer | 1 | | |
| 9 | Axial needle roller cage | 1 | | |
| 10 | Copper angle disc | 1 | | Install in correct position |
| 11 | Steel angle disc | 1 | | Install in correct position |
| 12 | Output shaft with freewheel | 1 | For dismantling, refer to page 38 - 127 | |

Note

Parts No. 1 to 5 should be fitted only after the 4th gear tower has been installed

Dismantling and assembly notes

Dismantling

1. Take Special Tool 9334 off the output shaft, lift the complete pack by the cylinder and place onto Special Tool 9314.

882-38

A - Special Tool 9314

2. Take off sun wheel and planetary set.

3. Turn over the complete pack on the output shaft and place on a suitable support (e.g. Special Tool 9508/1).

883-38

A = Special Tool 9508/1

4. Take off cylinder F and E

Assembly

1. Place preassembled output shaft on a suitable support (e.g. 9508/1).

2. Put steel and copper angle disc in place and fit cylinder E with a rotary motion.

Note

The teeth of the end disc and of the free-wheel outer ring must engage with each in such a manner that cylinder E rests on the copper angle disc.

4. If the freewheel has been fitted correctly, cylinder E must be free to rotate clockwise with the output shaft being held, but it must lock when an attempt is made to rotate it counterclockwise.

880-38

6. To prevent the preassembled pack from separating, allow **Special Tool 9334** to engage into the groove of the round seal.

885-37

A – Special Tool 9334

5. Fit axial needle roller cage and thrust washer. Place cylinder F onto cylinder E with a rotary motion until it is in assembly position.

884-38

Note

The teeth of end disc and freewheel outer ring engage only over a length of approx. 3 mm.

Dismantling and assembling output shaft and freewheel

| No. | Designation | Special tool | Order number | Explanation |
|-----|---------------|--------------|----------------|-------------|
| | Assembly ring | 9336 | 000.721.933.60 | |

Dismantling and assembling output shaft and freewheel

902-38

| No. | Designation | Qty. | Note: | |
|-----|----------------------|------|--|--|
| | | | Removal | Installation |
| 1 | Snap ring | 1 | Remove with suitable pliers and screwdriver | Install with suitable pliers (e.g. VW 161a) |
| 2 | Disc carrier | 1 | | |
| 3 | Freewheel outer ring | 1 | Rotate to lift off along with freewheel cage | Rotate clockwise to push onto inner ring along with freewheel cage |
| 4 | Thrust washer | 1 | | |
| 5 | Freewheel cage | 1 | Mark installation position for reassembly. Press carefully out of outer ring | Use Special Tool 9336 to place into outer ring |
| 6 | Thrust washer | 1 | | |
| 7 | Snap ring | 1 | | |
| 8 | Freewheel inner ring | 1 | | |
| 9 | Hollow gear | 1 | | |
| 10 | Rectangular ring | 1 | | Replace |
| 11 | Snap ring | 1 | | |
| 12 | Output shaft | 1 | | |

Dismantling and assembly notes

Dismantling

1. Remove snap ring (No. 1) and take off freewheel assembly along with disc carrier and hollow gear.

Assembly

1. Place freewheel cage onto outer ring and align.
2. Use Special Tool 9336 to compress freewheel cage and to push it into the outer ring.

3. Push freewheel outer ring onto inner ring, following a clockwise rotary motion.

887-38

4. Determine gap between freewheel inner ring and freewheel outer ring. A minimum gap of 0.1 mm must remain.

888-38

886-38

A - Special Tool 9336

Dismantling and assembling clutch E

| No. | Designation | Special tool | Order number | Explanation |
|-----|---------------|--------------|----------------|-------------|
| | Assembly tool | 9335 | 000.721.933.50 | |

Dismantling and assembling clutch E

908-38

| No. | Designation | Qty. | Note: | |
|-----|--------------------------------|------|--|--|
| | | | Removal | Installation |
| 1 | Snap ring | 1 | | |
| 2 | End disc (with internal teeth) | 1 | | Do not confuse with end disc of brake F |
| 3 | Outer disc (1.5 mm thick) | 5 | | Do not confuse with outer discs of brake F |
| 4 | Inner disc | 4 | | |
| 5 | Retainer ring | 1 | Remove with Special Tool 9335, using a press | Install with Special Tool 9335, using a press |
| 6 | Cup spring | 1 | | Convex side faces retainer ring |
| 7 | Thrust cup | 1 | | Place into position with convex side facing down |
| 8 | Piston | 1 | To remove, apply compressed air across oil feed bore | Grease round seals (with Vaseline) and press piston carefully in place, making sure it does not bind |
| 9 | Round seal | 1 | | Replace |
| 10 | Round seal | 1 | | Replace |
| 11 | Cylinder | 1 | | |

Dismantling and assembly notes

Dismantling

1. Remove retainer ring with Special Tool 9335 and a bar magnet, using a press.

870-38

- A - Special Tool 9335
B - Split retainer ring

2. Remove piston by applying compressed air across the oil feed bore.
Use a air gun fitted with a sealing sleeve.

871-38

Assembly

1. Fit split retainer ring with Special Tool 9335 and a press, observing the correct position.

870-38

2. Coat discs with ATF fluid.

Measure air gap**Standard: 1.16...2.74 mm**

1. Use a screwdriver to press snap ring upwards along its entire circumference and measure air gap with a feeler gauge. If the wear limit has been reached, the entire disc pack must be replaced.

918-38

Dismantling and assembling brake F

| No. | Designation | Special tool | Order number | Explanation |
|-----|---------------|--------------|----------------|-------------|
| | Assembly tool | 9335 | 000.721.933.50 | |

| 2 | End disc (without internal teeth) | 1 | | Do not confuse with end disc of clutch E |
| 3 | Inner disc | 4 | | |
| 4 | Outer disc (2.1 mm thick) | 4 | | Do not confuse with outer disc of clutch E |
| 5 | Ring (split) | 1 | Remove with Special Tool 9335 and a press | Install with Special Tool 9335 and a press, observing correct position. Stepped side faces inside. |
| 6 | Cup spring | 1 | | Lugs face inside |
| 7 | Piston | 1 | Press out of cylinder from outside, using a suitable tool | Grease round seals (with vaseline) and press carefully into cylinder, making sure the piston does not bind. |
| 8 | Sealing ring | 1 | | Replace To avoid damage, expand ring slightly and fit at once |
| 9 | Round seal | 1 | | Replace |
| 10 | Rectangular ring | 2 | | Hooked ends must engage into each other |
| 11 | Cylinder | 1 | | |

Dismantling and assembly notes

Dismantling

1. Remove split ring with Special Tool 9335 and a bar magnet, using a press.

863-38

Assembly

1. Install split ring with Special Tool 9335 and a press.

863-38

A - Special Tool 9335

B - Split ring

2. Using a suitable tool, press piston out of cylinder from the outside.

864-38

Measure air gap**Standard: 1.45...2.75 mm**

1. Use a screwdriver to press snap ring upwards along its entire circumference and measure air gap with a feeler gauge. If the wear limit has been reached, the complete disc pack must be replaced.

919-38

Dismantling and assembling brake pack CD with spider shaft

898-38

| No. | Designation | Special tool | Order number | Explanation |
|-----|------------------|--------------|----------------|-------------|
| | Assembly support | 9314 | 000.721.931.40 | |

Dismantling and assembling brake pack CD with spider shaft

| No. | Designation | Qty. | Note: | |
|-----|--|------|---|--|
| | | | Removal | Installation |
| 1 | Cylinder CD | 1 | Remove with centering plate and support ring. For dismantling, refer to page 38 - 152 | |
| 2 | Support ring | 1 | | |
| 3 | Planetary set | 1 | | Refer to "Dismantling and assembling brake D" (refer to page 38 - 152) |
| 4 | Sun shaft | 1 | | Hook ends of rectangular rings into each other |
| 5 | Axial needle roller cage | 1 | | |
| 6 | Thrust washer | 1 | | |
| 7 | Spider shaft (with hollow gear and intermediate shaft) | 1 | For dismantling, refer to page 38 - 147 | |

Note

To dismantle, place spider shaft with cylinder CD onto Special Tool **9314**.

Dismantling and assembling spider shaft

899-38

| No. | Designation | Special tool | Order number | Explanation |
|-----|------------------|--------------|----------------|-------------|
| | Assembly support | 9314 | 000.721.931.40 | |

Dismantling and assembling spider shaft

| 18 | Adjusting outer disc | 1 | | If required, reestablish correct thickness |
| 19 | Inner disc | 5 | | To facilitate assembly, reinstall planetary set first |
| 20 | Outer disc | 5 | | |
| 21 | Snap ring | 1 | Using Special Tool 9332 and suitable snap ring pliers, remove with a press | Install with Special Tool 9333 , using a press |
| 22 | Cup spring | 1 | | |
| 23 | Piston D | 1 | To remove, apply compressed air across the oil feed bore | Grease seals with vaseline and press them carefully into cylinder, making sure the piston does not bind |
| 24 | Round seal | 1 | | Replace |
| 25 | Round seal | 1 | | Replace |
| 26 | Retainer ring (split) | 1 | Remove with Special Tool 9332 and a bar magnet, using a press | Install with Special Tool 9332 , using a press |
| 27 | Cup spring | 1 | | |
| 28 | Piston C | 1 | To remove, apply compressed air across the oil feed bore | Do not confuse with piston C'. Grease seals with vaseline and press carefully into cylinder, making sure the piston does not bind. |
| 29 | Round seal | 1 | | Replace |
| 30 | Round seal | 1 | | Replace |
| 31 | Woodruff key | 1 | | Place exactly into center of cutout of cylinder CD |
| 32 | Cylinder CD | 1 | | |

Dismantling and assembly notes

Dismantling

1. Remove retainer ring with Special Tool 9332 and a bar magnet, using a press.

874-38

A - Special Tool 9332
B - Split retainer ring

2. Remove pistons C and D by applying compressed air across the oil feed bores.

875-38

3. Remove snap ring with Special Tool 9332 and suitable pliers, using a press.

915-38

A - Special Tool 9332
B - Snap ring

3. Remove retainer ring with Special Tool 9332 and a bar magnet, using a press.

872-38

A - Special Tool 9332
B - Split retainer ring

4. Remove piston C' by applying compressed air across the poil feed bore.

873-38

2. Install retainer ring with Special Tool 9332, using a press.

874-38

Assembly

1. Install snap ring with Special Tool 9333, using a press.

879-38

A - Special Tool 9333

B - Snap ring

3. Coat discs with ATF fluid.
4. Place end disc (No. 10) into position so that the center tooth of the three adjacent teeth rests on the three notches (with cast lugs) of cylinder CD.

877-38

A - Lugs

5. The outer teeth of the outer discs C' must not protrude into the bevelled cutout of the cylinder.

878-38

6. Place centering plate in position so that the bevelled cam fits into the corresponding bevelled cutout of cylinder CD.

876-38

Determining air gap of brakes C', C and D

Brakes C' and C

Brake C'

Specification: 0.55...1.97 mm

Brake C

Specification: 0.63...2.40 mm

Determine air gap with a feeler gauge

Note

To avoid false readings, place centering plate under a suitable load (e.g. Special Tool 9508/1).

Brake C'

921-38

A - Special Tool 9508/1

Brake C

922-38

A - Special Tool 9508/1

If the wear limit has been reached, all discs must be replaced.

Brake D

Specification: 1,34...2,39 mm

The air gap may be adjusted using the adjustment outer disc (18) available in a variety of thicknesses.

Determine air gap with a feeler gauge.

Note

To avoid false readings, place support ring under a suitable load (e.g. Special Tool 9508/1).

923-38

A - Special Tool 9508/1

B - Special Tool VW 402

If the wear limit has been reached, all discs must be replaced and the air gap must be re-adjusted with the adjustment outer disc (18).

Dismantling and assembling clutch B

909-38

| No. | Designation | Special tool | Order number | Explanation |
|-----|-----------------|--------------|----------------|-------------|
| 1 | Thrust piece | 9332 | 000.721.933.20 | |
| 2 | Assembly sleeve | 9330/1 | 000.721.933.01 | |

Dismantling and assembling clutch B

906-38

| No. | Designation | Qty. | Note: | |
|-----|------------------------------|------|---|---|
| | | | Removal | Installation |
| 1 | Snap ring | 1 | | Redetermine thickness if required |
| 2 | End disc | 1 | | |
| 3 | Inner disc | 4 | | |
| 4 | Outer disc (2.1 mm thick) | 4 | | |
| 5 | Snap ring | 1 | Remove with Special Tool 9332 using a press | Install with Special Tool 9330/1 using a press, checking for correct seating |
| 6 | Tab washer | 1 | | |
| 7 | Cup spring | 1 | | Place in correct position |
| 8 | Piston | 1 | To loosen, apply compressed air across the oil feed bore and take out by knocking lightly on a wooden support | Grease round seals (use vaseline) and press carefully into cylinder F, making sure the piston does not bind |
| 9 | Round seal | 1 | | Replace |
| 10 | Round seal | 1 | | Replace |
| 11 | Rectangular ring | 1 | | Hook ends into each other |
| 12 | Cylinder | 1 | | |

Dismantling and assembly notes

Dismantling

1. Remove snap ring with Special Tool 9332 using a press.

866-38

A = Snap ring

2. To loosen, apply compressed air across the oil feed bore and take out by knocking lightly on a wooden support.

867-38

Assembly

1. Fit snap ring, placing internal section of Special Tool 9330/1 into position and pushing snap ring up to the taper. Then use outer section of Special Tool 9330/1 and a press to push the snap ring into the groove.

865-38

A = Special Tool 9330/1

B = Snap ring

2. Coat discs with ATF fluid.

Measuring the air gap

Standard: 1.23...1.57 mm

Note

The air gap can be adjusted with the snap ring (No. 1) that is available in three thicknesses (1.5 - 2.0 - 2.5 mm).

1. Use a screwdriver to press snap ring upwards along its entire circumference and measure air gap with a feeler gauge. If the wear limit has been reached, the entire disc pack must be replaced and the thickness of the snap ring must be redetermined.

917-38

Dismantling and assembling clutch A

Dismantling and assembling clutch A

| No. | Designation | Qty. | Note: | |
|-----|-----------------------|------|---|--|
| | | | Removal | Installation |
| 1 | Drive shaft | 1 | Separate from cylinder by tapping lightly on a wooden support | |
| 2 | Rectangular ring | 2 | | |
| 3 | Round seal | 1 | | Replace, coat with vaseline |
| 4 | Snap ring | 1 | Remove with a suitable thrust piece (e.g. plate of 9329), using a press | Install with a suitable thrust piece (e.g. plate of 9329), using a press |
| 5 | Disc pack AB | 1 | | |
| 6 | Spring disc | 2 | | |
| 7 | Adjustment outer disc | 1 | Record thickness for reassembly | Refit old discs or use new disc of the same thickness |
| 8 | Inner disc | 5 | | Wear limit: Thickness below 1.5 mm |
| 9 | Outer disc | 5 | | |
| 10 | Cup spring | 1 | | Install in correct position |
| 11 | Piston | 1 | To remove, apply compressed air across oil feed bore | Grease sealing rings (use vaseline) and press carefully into cylinder, making sure the piston does not bind. |
| 12 | Round seal | 1 | | Replace |
| 13 | Round seal | 1 | | Replace |
| 14 | Cylinder | 1 | | |

Dismantling and assembly notes

Dismantling

1. Press down disc carrier with a suitable thrust piece (e.g. plate of 9329) using a press, and take out snap ring.

868-38

A - Snap ring

B - Plate of Special Tool 9323

2. To remove piston, apply compressed air across the oil feed bore.

869-38

Assembly

1. If the wear limit of the inner discs has been reached, the entire disc pack must be replaced along with the old adjustment outer disc.
2. Coat discs with ATF fluid.

Determining the end clearance

Specification: 0.2...0.4 mm

Note

Check the end clearance whenever the transmission has been reassembled and readjust if required, using adjusting washer No. 12 (refer to page 37 - 105).

1. Assembly transmission (complete with spur gear drive and front transmission cover).
2. Screw centering pins 9321 into transmission case and apply some grease (vaseline) to stick paper gasket to sealing surface.

964-38

- A - Centering pins 9321
B - Gasket

3. Using some grease (use vaseline), stick the removed adjusting washer to the rear transmission case and put housing carefully into position.

961-38

- A - Centering pins 9321

4. Tighten all mounting screws to 46 Nm (34 ftlb).

5. Mount measuring sleeve of Special Tool 9338 with three mounting screws on the stator shaft in such a manner that no play remains.

962-38

- Slide measuring device of Special Tool 9338 over drive shaft teeth and tighten with clamping screw so that it cannot be tilted.

963-38

- Set measuring sleeve to zero with a certain preload.
- Determine end clearance by pulling the handle. Repeat measurement several times.

Note

If a deviation is detected, remove rear transmission housing again and fit a thinner or thicker adjusting washer as required. Recheck end clearance afterwards.

Disassembling and assembling the long joint flange

Disassembling and assembling the long joint flange

| No. | Designation | Qty. | Note: | |
|-----|-------------------|------|------------------------------------|---|
| | | | Removal | Installation |
| 1 | Circlip | 1 | | |
| 2 | O-ring | 1 | | Replace |
| 3 | Bearing cap | 1 | | |
| 4 | Rotary shaft seal | 1 | | Pack space between dust lip and sealing lip with grease (e.g. Shell 8420) and press in flush with suitable thrust piece |
| 5 | Ball bearing | 1 | Press off jointly with bearing cap | Press in until it bottoms with a suitable pressure piece |
| 6 | Protective ring | 1 | | |
| 7 | Joint flange | 1 | | |

Removing and installing the rotary shaft seal for the short joint flange

Removing

Note

The rotary shaft seal can also be replaced with the transmission in built-in condition.

1. Unscrew the hexagon screw for the joint flange and remove flange.

408-39

2. Lever out rotary shaft seal with **VW 681**.

Installing

1. Press in rotary shaft seal flush with suitable pressure piece.
2. Tighten hexagon screw for joint flange with **46 Nm (34 ftlb)**.

Sealing off the driving shaft

1. Drain ATF
2. Remove engine with gearbox (do not unbolt engine from gearbox).
3. Remove intermediate plate (see page 37 - 107).
4. Remove bearing cap with **Torx insert T 27** and replace rotary shaft seal. Pack space between dust lip and sealing lip with grease (e.g. Shell 8420).
Press-in depth 2.0 ± 0.5 mm.

423-39

A = Snap ring

B = Rotary shaft seal

A = Rotary shaft seal

422-39

5. Fit bearing cap with new O-ring and tighten fixing screws with **10 Nm**.
6. Remove snap ring for bearing cap at intermediate plate and pull out cap.

7. Replace rotary shaft seal.
Pack space between dust lip and sealing lip with grease (e.g. Shell 8420).
Press-in depth 2.0 ± 0.5 mm
8. Fit new O-ring and wet with ATF.
9. Insert bearing cap and fit snap ring.
10. Fill with ATF.

Adjusting the preload of the spur gear taper roller bearings

Adjusting spur gear II (intermediate gear)

1. Determine and record dimension "a" (e.g. 45.90 mm).

1030 - 39

2. Fit complete spur gear II and determine dimension "b" (e.g. 44.65 mm). Record measured value.

1031 - 39

3. Determine shim thickness by deducting dimension "b" from dimension "a" and adding a constant value of 0.22 mm (preload and thickness of compressed gasket).

Note

The constant value is 0.22 mm for all transmissions.

Example

| | | |
|--------------------|-------------|----|
| Dimension "a" e.g. | 45.90 | mm |
| Dimension "b" e.g. | - 44.65 | mm |
| | <u>1.25</u> | mm |
| Constant | + 0.22 | mm |
| Shim thickness | <u>1.47</u> | mm |

Note

Always round shim thickness up or down to the nearest 0.05 mm figure.

Adjusting spur gear I (drive gear)

1. Remove intermediate plate.
2. Remove adjusting shim (refer to page 37 - 108, No. 16).
3. Remove spur gear II (intermediate gear) for measurement.
4. Bolt up cover with intermediate plate (but without gasket).
Tighten all screws and bolts to 23 Nm (17 ftlb).
5. Internal puller (e.g. Schrem 20 - 30) into spur gear teeth.
6. Fit dial gauge holder VW 387 with dial gauge and zero out dial gauge with a preload of 2 mm.
7. Move spur gear I up and down on internal puller and read off play on dial gauge (e.g. 1.18 mm).

1029 - 39

A = Dial gauge extension

B = Internal puller

Note

Do not turn or tilt the spur gear when measuring the clearance. Repeat measuring process several times.

8. Determine shim thickness. Measured value plus 0.20 mm (preload and thickness of compressed gasket) equals shim thickness

Note

The constant value is 0.20 mm for all transmissions.

Example

| | |
|----------------|----------------|
| Measured value | 1.18 mm |
| Constant value | + 0.20 mm |
| Shim thickness | <u>1.38 mm</u> |

9. Fit a shim of the determined thickness (1.38 mm in our example).

Note

Always round shim thickness up or down to the nearest 0.05 mm figure.

Removing and installing differential and drive pinion

966-39

| No. | Designation | Special tool | Order number | Explanation |

Practical procedure when readjusting the drive set

If it becomes necessary to adjust drive pinion and ring gear, follow the below sequence to ensure an efficient working procedure:

1. Determine the total shim thickness "Stot" (S_1 plus S_2) for the specified preload on the taper roller bearings/differential.
2. Determine the thickness of shim " S_3 ".
3. Split the total shim thickness "Stot" into S_1 and S_2 so that the specified circumferential backlash is present between ring gear and drive pinion.

The aim of this adjustment is to restore the smoothest running position which has been achieved on test equipment in the production line.

To achieve correct results, greatest possible cleanliness for all assembly work and measuring procedures is essential.

When assembling the final drive assembly, it is only necessary to readjust drive pinion and ring gear or drive set if components have been replaced which have a direct influence on the adjustment. Refer to the following table to avoid unnecessary adjustment procedures!

| Adjust: | Ring gear ($S_1 + S_2$) | Drive pinion (S_3) |
|--|------------------------------|------------------------|
| Replaced component | | |
| Rear transmission case | x | x |
| Transmission side cover | x | |
| Bearing assembly for drive pinion | x | x |
| Drive set | x | x |
| Differential housing | x | |
| Taper roller bearing for differential | x | |

- 1 – Spacer S_1
- 2 – Spacer S_2
- 3 – Adjusting shim S_3
- E – Adjustment dimension

945-39

Correct results can only be achieved if assembly work and measuring procedures are carried out carefully and with maximum cleanliness.

Adjusting drive set

General

The setting of drive pinion and ring gear is a determining factor for the service life and smooth running of the rear-axle drive. Drive pinions and ring gear that have been checked for good tooth contact pattern and low noise in both directions of rotation on special test equipment are therefore matched during production. The position at which smoothest running can be achieved is determined by shifting the drive pinion axially, with the ring gear being kept within the tolerance of the prescribed tooth backlash. The deviation "r" from the specified design dimension "Ro" is measured, added to the design dimension "Ro" and engraved on the ring gear as setting value "E".

During initial production, drive sets that feature only the values for production setting were used. When replacing components on those drive sets that affect the drive pinion position directly (transmission housing and bearing assembly for drive pinion), a measurement of **actual values** is required (refer to page 39 - 131).

Production version "A"

994-39

- 1 - Backlash (e.g. 0.18 mm)
- 2 - Matching number

All other characters are used for adjustment in production.

Version "B" for service

996-39

1 - Backlash "F" (e.g. 0.18 mm)

2 - Matching number

3 - Setting dimension "E" (e.g. 64.05 mm)

Version "C" for service

996-39

R_0 - Design dimension (64.00 mm)

r - Deviation r

1 - Backlash "F" (e.g. 0.18 mm)

2 - Matching number

3 - Setting dimension "E" ($R_0 + r$)

The service versions also feature the production dimensions of version "A". However, they are offset by 180°.

Adjusting drive pinion

Note

The setting dimension "E" is indicated on the ring gear.

1. Install drive pinion **without** shims "S₃" and tighten all pan head screws of bearing assembly to 50 Nm (37 ftlb).
2. Rotate adjustable stop ring along with spindle towards measuring plunger as far as it will go and set second setting ring to dimension "a".

969-39

a = 30 mm

3. Assemble measuring mandrel and set with master gauge VW 385/30 to setting dimension "E" (64.05 mm in the example). Set dial gauge (3 mm measuring range) to zero with 1 mm preload.

970-39

4. Put gauge block plate 9281 on drive pinion head and insert measuring mandrel with dial gauge towards transmission side cover into transmission case. Dial gauge extension points towards center of drive pinion.

971-39

5. Fit transmission side cover without shaft seal and sealing ring and tighten crosswise with 4 hexagon head bolts.

Note

Do not use a hammer when fitting the transmission side cover (the gauge block plate held by magnets might fall off). Locate cover in correct installation position only by tightening the hexagon head bolts uniformly.

6. Using a socket wrench (24 mm A/F, e.g. Stahlwille No. 10 750), pull adjustable centering disc over spindle towards the outside until the measuring mandrel can just about be turned.
7. Turn measuring mandrel carefully until the dial gauge extension is vertical to the face of the drive pinion head. At this point, the pointer of the dial gauge is at its maximum deflection (reversing point) and the dial gauge must now be read.

Note

The measured value always deviates from the set dimension in clockwise direction (small pointer on the dial gauge is between 1 and 3), i.e. if the dial gauge is set with a preload of 1 mm, the value deviating from 1 is taken as the shim thickness "S₃" to be inserted.

Always round up or down to the nearest 0.05 mm (e.g. 1.63 to 1.60 mm).

8. After inserting the required shims, check the setting value "E" once again. A deviation of ± 0.03 mm is permissible.

Determining installation position of drive pinion

Measuring actual values

Note

Initial production vehicles used drive sets that did not have the "E" and "F" marks for service adjustment.

When replacing components that affect the drive pinion position directly on those transmissions, the actual values must be measured.

1. Remove differential.
2. Assemble measuring mandrel VW 385/1 and set to design dimension
"Ro" = 64.00 mm.
(Refer to page 39 - 129).
3. Install measuring mandrel and measure difference (deviation "r") to "Ro".
4. Design dimension "Ro" plus deviation "r" equals the actual or setting dimension "E".
5. After the parts have been replaced, adjust the drive pinion, taking the actual value determined into account.

Adjusting ring gear

Determining total shim thickness "Stot." ($S_1 + S_2$)

The ring gear must be readjusted if the transmission case, transmission side cover, taper roller bearing for differential, differential housing or drive set have been replaced.

Note

The drive pinion must be removed in order to determine the preload of the differential tapered roller bearings.

1. Remove adjusting shim "S₁" (in transmission side cover).
2. Adjusting shim "S₂" remains in the transmission case.
3. Make sure that the bearing outer races of the tapered roller bearings are well seated in the transmission case or in the transmission side cover.
4. Insert differential into transmission case and rotate several times.
5. Fit transmission side cover without seals and tighten all hexagon head bolts to **23 Nm (17 ftlb)**.
6. Place gauge block plate **9281** on the collar of the differential.
7. Fasten universal dial gauge holder **VW 387** with dial gauge and extension to the case and set to 0 with 2 mm preload.

973-39

A - Dial gauge extension (approx. 30 mm long)
B - Gauge block plate 9281

8. Using a suitable tool, move differential up and down.
Read off backlash on the dial gauge and note.

Note

Do not turn differential while measuring backlash as this will give an incorrect reading.

9. Remove adjusting shim "S₂" and determine thickness using a micrometer.
10. Calculate "Stot".
"Stot." = Thickness of adjusting shim "S₂"
+ measured value
+ pressure fit of taper roller bearings

Example

| | |
|--|----------------|
| Thickness of adj. shim "S ₂ " | 1.70 mm |
| Measured value | 0.91 mm |
| Press fit (constant value) | 0.24 mm |
| "Stot" | <u>2.85 mm</u> |

11. Spread calculated shim thickness "Stot" as follows.

To start with the backlash adjustment, the thickness of adjusting shim "S₁" is reduced by 0.40 mm while the thickness of adjusting shim "S₂" is increased by 0.40 mm.

Example

Total shim thickness of adjusting shims

$$S_1 + S_2 = 2.85 \text{ mm}$$

Thickness of adjusting shim "S₁"

$$\begin{array}{rcl} 2.85 \text{ mm} & = & 1.425 \text{ mm} \\ \hline 2 & & - 0.40 \text{ mm} \\ & & \hline & & 1.025 \text{ mm} \end{array}$$

Thickness of adjusting shim "S₂"

$$\begin{array}{rcl} 2.85 \text{ mm} & = & 1.425 \text{ mm} \\ \hline 2 & & + 0.40 \text{ mm} \\ & & \hline & & 1.825 \text{ mm} \end{array}$$

Note

The adjusting shims are avail. in thicknesses of 1.0...2.0 mm in increments of 0.05 mm.

The shim thicknesses calculated must be rounded up or down for plausible dimensions that will not alter the total shim thickness S₁ and S₂.

Example

Calculated shim thickness

$$S_1 + S_2 = 1.025 + 1.825 = 2.85 \text{ mm}$$

Rounded down shim thickness

$$S_1 + S_2 = 1.00 + 1.85 = 2.85 \text{ mm}$$

Adjusting circumferential backlash

Note

The backlash to be set is embossed on the ring gear.

1. Mount gear set using the shims "S₃" determined while adjusting the drive pinion and tighten all mounting screws to 50 Nm (37 ftlb).

Note

Make sure the collar nut of the drive pinion is tightened to 250 Nm (184 ftlb).

2. Fit the adjusting shims (S₁ + S₂) determined into the transmission case and the transmission side cover, respectively.
3. Fit differential and transmission side cover and tighten all hexagon head bolts of the cover to 23 Nm (17 ftlb).

Note

Always make sure that there is a certain amount of backlash when tightening the hex bolts. Never allow the drive pinion to bind.

4. Assemble measuring lever **VW 388** and adjusting device **VW 521/4** and adjust lever length to 80 mm with the plunger. Refer to dimension "a" in the picture.
5. Insert adjusting device with clamping sleeve (Special Tool 9145) into the differential and clamp firmly.
6. Rotate differential in both directions several times to settle the tapered roller bearings.

7. Fit universal dial gauge holder with flat extension in such a way as to produce a right angle between dial gauge axis and lever.

972-39

Dimension "a" = approx. 80 mm

8. Turn ring gear carefully at the clamping screw of the adjusting device up to the stop and set the dial gauge to zero. Turn back ring gear and read off circumferential backlash. Note the reading.

Note

When carrying out measurements, the drive pinion must be blocked with Special Tool 9339.

1129-39

9. After turning the ring gear a further 90° each, repeat measuring procedures three times. The measured values must not deviate from one another by more than 0.05 mm.

Note

The backlash to be adjusted is embossed on the ring gear. The actual value may be less than the specified value by - 0.05 mm. Under no circumstances must the backlash be greater than the specified value.

10. If the required backlash cannot be obtained, replace spacers (S1 + S2) again. The total shim thickness (S tot.) must not be altered, however.

Note

Changing the shim thickness of "S1" or "S2" by 0.05 mm shim results in a change of backlash by approx. 0.1 mm.

Tiptronic Diagnosis / Troubleshooting

Functional Overview

This is how the information is processed in the Tiptronic control unit

The Tiptronic control unit is located below the left-hand seat and is built into a housing that is slightly smaller than the DME control unit located in the same place.

The following parameters are constantly supplied to the Tiptronic control unit:

Parameter

- Throttle position
- Throttle actuation speed
- Engine speed
- Driving speed
- Vehicle transverse acceleration
- Vehicle axial acceleration/deceleration

Type of measurement

- Potentiometer resistance
- Time for change of resistance at potentiometer
- Frequency measurement (from DME)
- No. of pulses at pole wheel of transmission shaft
- Signal from transverse acceleration sensor on center console
- Change of no. of pulses within clock time

The above values are determined several times per second and are processed in the control unit.

By comparing those measurements with the stored programs, factors are generated that cause the transmission to enter or to shift into one of the five shift curves.

The automatic shift strategy of the Porsche Tiptronic

- | | |
|-------------------------------------|--|

| 4 Kickdown switch | 11 Automatic transmission |
| 5 DME control unit | 12 Throttle with potentiometer |
| 6 Electronic Tiptronic control unit | 13 911 Carrera 2 engine |
| 7 Transverse acceleration sensor | |

The electronic Tiptronic control unit (6) is the information and command center of the entire system. A large quantity of **information inputs** that are compared with the stored **driving or gearshift programs** is used to generate **commands** that **cause the transmission to execute or not to execute** gearshifts.

Major Data at a Glance:

Automatic four-speed sports transmission with integral hypoid final drive, with manual and automatic shift features.

No. of gears: 4 forward gears, 1 reverse

Stall speed 2,300 rpm – 400 rpm

Control unit: 8-bit microprocessor with external 32 KB EPROM memory

Transmission unit overall weight: 98 kg

Extra weight: 911 Carrera 2 vehicle with Tiptronic: 34 kg

Filling capacities:

Automatic section: Initial filling approx. 9.1 l, ATF Dexron II D

This quantity is reduced accordingly when ATF fluid is changed

Final drive: 0.9 l transmission oil GL5 (MIL L 2105B)
either multigrade SAE 75 W 90
or single grade SAE 90

Start of diagnosis

To assess a Tiptronic transmission for which complaints have been received, the information about the fault and the fault occurrence should be as complete as possible.

To avoid extra damage during test drives or faulty diagnosis results, the following items must be checked and corrected (if required) prior to the test drive:

1. Read out fault memory with System Tester 9288 and correct fault.
Battery, connectors, ground points O.K.
2. External damage, leaks at transmission (ATF leaks) or final drive (hypoid oil loss), disconnected cables.
3. ATF level in transmission correct, fluid is **neither dirty nor does it leave a burning smell**. If ATF is dirty or if it leaves a burning smell, it is recommended to replace the Tiptronic transmission if complete removal of the dirt residues cannot be ensured. In addition, the coolant lines and the cooler must be flushed.
4. Engine operation, full opening of throttle when accelerator is in full-throttle position

Notes:

If a system fault occurs, the Tiptronic system shifts into a reduced driving program. The warning lamp comes on and the automatic system shifts to 4th gear, irrespective of the selector lever position.

If the vehicle is started again in the "P" or "N" selector lever position after it has been stopped, only 3rd gear is activated in the "D", 3, 2 or 1 selector lever positions.

Caution: The reverse gear interlock monitor is inoperative.

Do not shift into "R" while the vehicle is in motion.

The test drive

The test drive should be used to check if the customer complaint situations actually occur when the vehicle is driven. It is actually preferable to have the customer drive the car and to check for any potential faults, malfunctions or even for incorrect operation by the driver.

Check all functions of the transmission during the test drive:

- All shifts, including in kickdown position in the automatic gate, as well as shifts in the manual gate
- Various driving speeds
- Driving in reverse (uphill if possible)
- Stall speed

A safe diagnosis is only possible if you are familiar with the design and operation of the Tiptronic transmission. Read the Functional Description brochure carefully: Porsche Tiptronic WKD 496 620.

Make your diagnosis using the "Troubleshooting the Tiptronic transmission" section and determine the type of repair required.

This diagnosis plan is based on the fault memory contents. If no fault is stored although a malfunction is present, the troubleshooting plan for the mechanical/hydraulic section should be used.

Troubleshooting requires that the person performing the tests

- is familiar with the location of components, operation and technical relationships of the systems being tested (refer to Model Information)
- is able to read and evaluate Porsche wiring diagrams
- knows the functions of circuits and relays
- is capable of using testers such as oscilloscope, voltmeter, ohmmeter and ammeter, as well as of evaluating the test results.

Important:

The fault text displayed (fault list in case of flashing code) does **not** necessarily indicate a defect in this component, but may also refer to a fault in the corresponding control unit and the wiring (paths) between the component and the control unit.

Before reading out the fault memory, do not try to locate faults by disconnecting plugs etc. while the engine is running as this may be stored as a fault in the fault memory.

Note for System Tester 9288

If the tester display shows

Fault not present, this may indicate:

- Fault did not exist at the time of testing (e.g. in the case of loose connections)
Remedy: Visual inspection of path
- The conditions under which the fault is tested do not correspond to the conditions under which the fault occurred.
Remedy: Conform with the conditions displayed on the tester

Signal unplausible:

The signal of the monitored component is not within the tolerance range of the value preset in the control unit.

Diagnosable Tiptronic control unit

A self-diagnosis feature with fault memory is built into the Tiptronic control unit to allow certain faults within the electronic control system of the Tiptronic to be detected and to be stored.

To prevent detected and stored faults from being erased when the ignition is switched off, a permanent positive voltage is present at the control unit. Detected faults remain stored in the fault memory for at least 50 starts of the engine.

Caution:

If the connector is pulled off the Tiptronic control unit or if the battery is disconnected, the fault memory is erased.

Tester connections

To run the diagnosis, the vehicles are fitted with a 19-pin connector in the passenger footwell.

This connector allows System Tester 9288 or the Flashing Code Tester 9268 (via adapter cable 9268/2) to be connected. Operation of the testers is described in the tester instruction manuals.

Note

The relevant test point is complemented by the corresponding fault flasher code of Tester 9268. As of tester module level 4.0, the following items can be checked or read out with System Tester 9288:

| Input signals with „Input signals“ menu | Actual values with „Actual values“ menu | Actuators (Drive links) with „Drive links“ menu |
|--|--|--|
| Kickdown | Rpm | Solenoid valve 1 |
| Downshift | Speed 1 | Solenoid valve 2 |
| Upshift | Speed 2 | Torque converter clutch |
| Manual program | Injection time | Gear indicator 1 - 4 |
| Selector lever | Throttle | Reverse relay (G 01) |
| | Temperature | Ignition timing change |
| | Transverse acceleration | |
| | Selector lever switch | |
| | Gear | |
| | Voltage supply | |
| | Version coding | |

General

Auxiliary tools

Use of the following auxiliary tools is recommended when checking the Electronic Transmission Control (EGS - **E**lektronische **G**etriebe **S**teuerung):

- Diagnosis Tester 9288 with connection cable
- Voltage and resistance meter for internal resistance > 10 M Ω
- Oscilloscope
- Jump lead with matching spade connectors

General information

- Do not run resistance measurements on live wiring
- If poor terminal connections are found,
 - check wiring for damage
 - check connector terminals for tight fit, tight wire connections, deformation and corrosion
 - Before replacing the transmission or the electronic control unit, always check the wiring harness and system components with the System Tester. Otherwise new new control unit or transmission may be destroyed again.

Abbreviations:

TE = Transmission electronics= – System components

ECU = Electronic transmission control unit

HCU = Hydraulic transmission control unit

Signals that can be checked with the oscilloscope

- Speed signal (from ABS)
- Speed signal (from transmission)
- Rpm signal (n-Mot) (from DME)
- ti signal (load of DME)

Definitions

System voltage

The system voltage reflects the current charging state of the battery. When the battery is discharged, the voltage is approx. 11 V; when the engine is running it is approx. 14.5 V

Needle pulse

Needle pulses are pulses of extremely short duration that appear as a vertical line on the oscilloscope (tr signal)

Unit functions

Installed units must operate correctly within a voltage range of 9.5 to 16.8 Volts.

Faults that cannot be detected by self-diagnosis

The ECU cannot detect and store all potential faults.

If a fault is found and if no fault has been stored, the tester may be used to run a system check to indicate any faults that may be present.

Some of these faults are stated below.

- No diagnosis possible, Test point 0
No diagnosis is possible if the diagnostic leads are faulty.
- Terminal 15, Test point 1
If terminal 15 is inoperative, the system enters the (mechanical-hydraulic) emergency mode. The fault lamp does not come on.
- Terminal 30, Test point 2
If terminal 30 is inoperative, all faults that may have been stored are erased after the ignition is switched off.
- DME rpm signal is missing. Test point 2: Actual values, connector to DME.
- Tiptronic is in emergency mode, warning lamp comes on. No Tiptronic diagnosis possible.
If all above items are o.k.: Replace ECU
- Transmission oil level o.k.?
- Start interlock feature
It must only be possible to start the engine in the P and N selector lever positions. Check selector lever switch to ignition switch cable.
- Several faults
If several faults occur, this may be due to a missing ground lead (e.g. the common ground lead of the sensors at ECU pin 44), ground of body engine/transmission.
- Gear selected
If the gear selection feature is faulty, the position switch should be checked (Test point 13).

Fault, Fault code**Possible Causes, Elimination, Remarks****Test point 0****K and L wire**

The diagnostic connection between the ECU control unit and the tester is made across the K and L wires.

If it is not possible to run a diagnosis on all systems, the following checks should be made:

1) Continuity check (refer to wiring diagram)

- L wire: Pin 7 (diagnosis socket) to Pin 13 (ECU connector)
- K wire: Pin 8 (diagnosis socket) to Pin 51 (ECU connector)

2) Short to ground check (refer to wiring diagram)

- L wire: The voltage at pin 7 (diagnosis socket) should be $> 8\text{ V}$ when the ignition is switched on.
- K wire: The voltage at pin 8 (diagnosis socket) should be $> 8\text{ V}$ when the ignition is switched on.

Possible cause:

- Short to ground or open circuit on the wiring or connectors.
- A defective control unit connected to those wires. (May be any diagnosable control unit, must not necessarily be the ECU control unit.)

To determine the faulty control unit, pull off the control unit connectors one after another until a voltage of $> 8\text{ V}$ is present.

Bushing 3 = L wire

Bushing 4 = Ground

Bushing 5 = Terminal 15

Bushing 7 = K wire

See also page 03 - 43.

Troubleshooting the Tiptronic transmission (mechanical/hydraulic section)

Introduction

The below troubleshooting chart for the mechanical/hydraulic section of the Tiptronic is designed as a guideline for repair operations.

The faults have been arranged in the way they are usually indicated by the customers. Deviations of the descriptions are possible and should be completed accordingly by the service personnel.

If complaints about leaks are received it is recommended to determine the location of the leak as closely as possible before any sealing operations are started. Crack testing agents such as

Spot - Check or Met-L-Check

are suitable for this purpose. These products are marketed as spray cans and allow positive identification of the leak after a short test drive.

Troubleshooting procedure: Proceed in the sequence of the selector lever positions, starting with

| | |
|-------------------------|-----------------|
| 1. Position P | Page D 38 - 103 |
| 2. Position R | Page D 38 - 103 |
| 3. Position N | Page D 38 - 105 |
| 4. Position D | Page D 38 - 105 |
| 5. Position 3, 3rd gear | Page D 38 - 108 |
| 6. Position 2 | Page D 38 - 108 |
| 7. Position 1 | Page D 38 - 108 |
| 8. Torque conv. clutch | Page D 38 - 108 |
| 9. General | Page D 38 - 109 |
| 10. Leaks | Page D 38 - 110 |
| 11. Noises | Page D 38 - 111 |

Clutches, brakes and freewheels applied in the individual gears

* engine brake effective in overrun mode

This overview allows the components affected to be located if mechanical damage has occurred.

Troubleshooting mechanical/hydraulic section

(Causes indicated in italics are located in the HCU)

| Fault | Possible cause | Remedy |
|--|---|---|
| 1. Position P | | |
| 1.1 Parking position does not engage | <ul style="list-style-type: none"> Shift cable between shift lever and transmission adjusted incorrectly Excessive friction in parking lock mechanism | <ul style="list-style-type: none"> Correct adjustment Replace parking lock components (linkage rod, pawl) or make them operative again |
| 1.2 Parking position does not remain engaged (jumps out of gear) | <ul style="list-style-type: none"> Shift cable between shift lever and transmission adjusted incorrectly | <ul style="list-style-type: none"> Correct adjustment |
| 1.3 Engine cannot be started | <ul style="list-style-type: none"> Position switch adjusted incorrectly Position switch faulty | <ul style="list-style-type: none"> Correct adjustment Replace position switch Refer to diagnosis item 16 |
| 2. R Position | | |
| 2.1 No reverse gear | <ul style="list-style-type: none"> Shift cable between shift lever and transmission adjusted incorrectly <i>Reverse lock remains operative</i> Oil strainer clogged Clutch B destroyed. No third gear is therefore available Brake D destroyed. No engine brake effect is therefore available in position 1, 1st gear Clutch E destroyed. Hence no engine brake effect in 2nd and 3rd gear as well as in position 1, 1st gear | <ul style="list-style-type: none"> Correct adjustment <i>Replace HCU</i> Refer to item 11.2 Replace transmission* Replace transmission* Replace transmission* |

* Repair possible if ATF fluid does not contain excessive dirt; otherwise replace transmission.

| Fault | Possible cause | Remedy |
|--|--|---|
| 2.2 Poor power transmission | <ul style="list-style-type: none"> • <i>Pressure in clutch B or E or brake D is too low</i> | <ul style="list-style-type: none"> • <i>Replace HCU</i> |
| 2.3 Slipping or judder when moving off | <ul style="list-style-type: none"> • Clutch B or E or brake D damaged | <ul style="list-style-type: none"> • Repair or replace transmission* |
| 2.4 Hard, bumpy engagement of P-R or N-R or clearly noticeable double shock during P-R or N-R shifts | <ul style="list-style-type: none"> • Idle speed too high • <i>Damper B faulty. In this case, 2-3 shift operations will also be impaired</i> • <i>Modulating pressure excessively high</i> • Rectangular rings on cylinder F/hub E side leaky | <ul style="list-style-type: none"> • Adjust engine • <i>Replace HCU</i> • Check TE • Refer to diagnosis item 13 • <i>Replace HCU</i> • Replace transmission |
| 2.5 Reverse light does not light (electrical system o.k.) | <ul style="list-style-type: none"> • Position switch adjusted incorrectly • Position switch faulty | <ul style="list-style-type: none"> • Correct adjustment • Replace position switch • Refer to diagnosis item 14 |
| 2.6 No reverse and no forward gear | <ul style="list-style-type: none"> • <i>Main pressure valve stuck</i> • <i>Main pressure valve spring broken</i> | <ul style="list-style-type: none"> • <i>Replace HCU</i> |
| 2.7 Vibrations in reverse gear | <ul style="list-style-type: none"> • Torque converter out of balance | <ul style="list-style-type: none"> • Replace torque converter |

* Repair possible if ATF fluid does not contain excessive dirt; otherwise replace transmission.

| Fault | Possible cause | Remedy |
|---------------------------------|---|--|
| 3. N Position | | |
| 3.1 Engine cannot be started | <ul style="list-style-type: none"> • Position switch adjusted incorrectly • Position switch faulty | <ul style="list-style-type: none"> • Correct adjustment • Replace position switch • Refer to diagnosis item 17 |
| 3.2 Vehicle moves off or creeps | <ul style="list-style-type: none"> • Shift cable between shift lever and transmission adjusted incorrectly • Clutch A faulty (welded up) • Second rectangular ring on turbine shaft faulty | <ul style="list-style-type: none"> • Correct adjustment • Replace transmission* • Seal |
| 4. D Position | | |
| 4.1 No power flow | <ul style="list-style-type: none"> • Shift cable between shift lever and transmission adjusted incorrectly • Oil strainer clogged • <i>Main pressure valve stuck</i> • <i>Main pressure valve spring broken</i> • Clutch A faulty • 1st gear freewheel slipping | <ul style="list-style-type: none"> • Correct adjustment • Refer to item 11.2 • <i>Replace HCU</i> • <i>Replace HCU</i> • Replace transmission* • Replace transmission* |
| 4.2 Poor power transmission | <ul style="list-style-type: none"> • <i>Pressure in clutch A too low</i> | <ul style="list-style-type: none"> • <i>Replace HCU</i> |

* Repair possible if ATF fluid does not contain excessive dirt; otherwise replace transmission.

| Fault | Possible cause | Remedy |

| 7.1 Manual downshift 2-1 not o.k. | <ul style="list-style-type: none"> • <i>Shift valve 1-2 stuck</i> • <i>Damper D faulty</i> • <i>Modulating valve binding</i> | • <i>Replace HCU</i> |
| 7.2 No engine braking effect | <ul style="list-style-type: none"> • Brake D or clutch E damaged | • Replace transmission* |
| 8. Torque converter clutch | | |
| 8.1 Shift progressions too harsh | <ul style="list-style-type: none"> • <i>Torque converter clutch damper faulty</i> • Torque converter not o.k. | <ul style="list-style-type: none"> • <i>Replace HCU</i> • Replace torque converter |
| 8.2 No converter clutch shift | <ul style="list-style-type: none"> • <i>Shift slide for torque converter stuck</i> • Torque converter faulty | <ul style="list-style-type: none"> • <i>Replace HCU</i> • Replace torque converter |

* Repair possible if ATF fluid does not contain excessive dirt; otherwise replace transmission.

| Fault | Possible cause | Remedy |
|--|--|---|
| 8.3 Torque converter clutch always closed (engine stalls in driving position) | | • <i>Replace HCU</i> |
| 8.4 Power flow during or after starting | • Torque converter clutch faulty | • Replace torque converter |
| 9. General | | |
| 9.1 Noises are audible after longer driving periods and power flow is interrupted subsequently | • Oil strainer of HCU clogged | • If no burnt clutch lining is present in the oil pan, only the oil strainer requires replacing. Replace transmission in all other cases. |
| 9.2 No forward or rear power flow, heavy noises | • Driver plate between torque converter and engine torn off • Pump driver torn | • Replace driver plate or torque converter, respectively • Replace transmission* |
| 9.3 Engine is stalled when braking heavily to standstill | • <i>Torque converter valve faulty</i> • Torque converter quick-opening feature (only standardized as of M-program) | • <i>Replace HCU</i> • Install M program ECU |
| 9.4 Power flow is interrupted during heavy braking and subsequent acceleration | • Transmission with old type of oil strainer (prior to transmission No. 1850) | • Fit oil strainer with pickup tube (standard as of transmission No. 1850) |

* Repair possible if ATF fluid does not contain excessive dirt; otherwise replace transmission.

| Fault | Possible cause | Remedy |
|---|---|---|
| 10. Leaks | | |
| 10.1 Oil drips from torque converter bell housing | <ul style="list-style-type: none"> • Seal in pump housing damaged • Pump housing leaky • Torque converter leaks at weld joint | <ul style="list-style-type: none"> • Replace oil seal • Replace pump assy. • Replace torque converter |
| 10.2 Leaks between transmission housing and oil sump | <ul style="list-style-type: none"> • Oil sump mounting bolts not tightened to specified torque • Oil sump gasket damaged | <ul style="list-style-type: none"> • Retighten bolts • Replace gasket |
| 10.3 Leaks between intermed. plate and transmission housing (particularly in pump pressure hole area) | <ul style="list-style-type: none"> • Torque converter bell housing mounting bolts have worked loose | <ul style="list-style-type: none"> • Retighten bolts |
| 10.4 Oil loss at transmission connector | <ul style="list-style-type: none"> • O-ring damaged | <ul style="list-style-type: none"> • Replace O-ring |
| 10.5 Oil loss on output end | <ul style="list-style-type: none"> • Shaft seal on output side damaged | <ul style="list-style-type: none"> • Replace oil seal |
| 10.6 Oil loss across or at breather | <ul style="list-style-type: none"> • Oil level too high • Incorrect oil (excessive foaming) • Breather cover missing • O-ring at breather damaged • Lock washer preload insufficient | <ul style="list-style-type: none"> • Correct oil level • Change oil, remove transmission if required and drain complete with torque converter • Refit cap or replace breather as required • Replace O-ring • Replace lock washer |
| 10.7 Oil loss at cooler line | <ul style="list-style-type: none"> • Bolt connection has worked loose • Cooler pipe damaged • Cooler leaky | <ul style="list-style-type: none"> • Retighten bolts • Replace cooler pipe • Replace cooler |

| Fault | Possible cause | Remedy |
|---|--|--|
| 10.8 Oil loss at intermediate plate | <ul style="list-style-type: none"> • Plug at intermediate plate is leaking | <ul style="list-style-type: none"> • Retighten plug • Replace seals |
| 10.9 Leaks between transmission housings | <ul style="list-style-type: none"> • Mounting bolts have worked loose • Gasket damaged | <ul style="list-style-type: none"> • Retighten bolts • Replace gasket |
| 10.10 Oil loss at rear axle breather | <ul style="list-style-type: none"> • Oil level excessively high • Oil buildup in housing area of long joint flange | <ul style="list-style-type: none"> • Correct oil level |
| 11. Noises | | |
| 11.1 High-pitched noise in all shift positions, particularly while oil is cold. Oil pump intake noise | <ul style="list-style-type: none"> • Oil level too low • <i>HCU leaky</i> • Pump bushing has seized | <ul style="list-style-type: none"> • Correct oil level • <i>Replace HCU</i> • Replace pump |
| 11.2 High-pitched, chirping noise varying with rpm in all shift positions, particularly when engine is hot, may appear after longer driving periods, sometimes in conjunction with interruption of power flow | <ul style="list-style-type: none"> • Oil strainer clogged | <ul style="list-style-type: none"> • Replace oil strainer if no friction lining residues are found in the oil sump. Replace the complete transmission assy. in all other cases. |
| 11.3 Heavy noise when torque converter clutch is closed | <ul style="list-style-type: none"> • Torsion damper faulty | <ul style="list-style-type: none"> • Replace torque converter |
| 11.4 Noises in reverse | <ul style="list-style-type: none"> • Pump bushing has seized | <ul style="list-style-type: none"> • Replace pump |
